

## CSS Frameworks

CSS is a powerful programming language used by front-end developers to design websites. However, sometimes it can be very time consuming to design an entire website from scratch using CSS. That is where CSS Frameworks such as “Bootstrap” come in. Designers can quickly import pre-developed user interfaces. Designers can choose different elements from the CSS frameworks such as buttons or navigation bars.

CSS Frameworks also help teams of developers set certain standards for user interfaces. This way, designers don’t have to share a ton of CSS with team members, instead they can just choose which style to use from the CSS frameworks.

All in all, CSS Frameworks allow designers to reach a minimum viable product (mvp) faster, and easier.
